SKILLS:

Programming language:

- JavaScript
- PHP
- Golang

Web Technologies:

- HTML
- CSS
- SCSS

Frontend Frameworks:

- React
- Angular
- Svelte
- Astro
- NextJS
- SolidJS

UI Frameworks:

- Tailwindcss
- Material UI
- ChakraUI
- Shadcn ui
- Radix
- Ant Design
- Styled Components

State managements:

- Redux Toolkit
- Zustand
- Recoil
- Effector
- Nanostores
- RxJs

API:

- REST API
- GraphQL
- WebSocket
- Server-Sent Events
- OpenAPI / Swagger
- TanStack Query

Builders:

- Webpack
- Vite

Architecture and approaches:

- SSR
- SSG
- SPA
- Feature-Sliced Design

OBJECTIVE

Frontend Software Developer from Belarus, currently based in Poland, with 8 years of commercial experience in developing web applications and websites. Strong background in frontend development, solution-oriented approach, and responsibility for delivering reliable user-facing features. I also have backend experience from pet projects using Node.js and Golang, and I am currently expanding my backend skills to strengthen my fullstack development capabilities.

WORK EXPIRIENCE

• FRONTEND DEVELOPER

Techvice | Grodno 2018-2022

• SENIOR FRONTEND DEVELOPER

Techvice Sp. z o.o | Białystok May 2022- Oct 2024

• SENIOR FRONTEND DEVELOPER

B2B Freelance | Gdansk Oct 2024 - until now

EDUCATION

• Web design and programming

Yanka Kupala State University of Grodno | Grodno 2013-2016

• IT Frontend courses

IT Academy | Minsk 2017- 2018

PROJECTS

• Telegram Chrome Extension (Chrome Side panel)

Built a Chrome Manifest V3 side-panel Telegram client using React, TypeScript, Vite and GramJS/MTPProto. Implemented QR/phone/2FA authentication, encrypted session storage with WebCrypto, live dialog updates, chat history pagination, rich media rendering, notifications, and message/file sending, editing and deletion.

• VPN (with AI Agents)

Full-stack VPN platform for selling and managing WireGuard/AmneziaWG access. Built an Astro/React website, Telegram bot, admin dashboard, billing webhooks, automated VPN config provisioning, traffic accounting, subscription lifecycle management, and Docker-based deployment infrastructure. Stack: TypeScript, Node.js, Astro, React, PostgreSQL, Redis, Docker, WireGuard/AmneziaWG.

• VoltmaxPL

Built a multilingual B2B landing page for Voltmax Energia using Astro, Svelte, TypeScript and Tailwind CSS. Implemented an interactive energy savings calculator, multi-step lead forms, HubSpot CRM integration with OAuth, file uploads, UTM tracking, SEO setup and Cloudflare deployment.

• GalaxyBrain

GalaxyBrain — a local-first React/TypeScript knowledge-base app with a custom TipTap editor, filesystem-backed JSON storage, multi-pane navigation, drag-and-drop tabs, page links, templates, computed variables, metadata aggregation, and image handling.

• Mediatool

Enterprise web platform for TV/media operations, focused on content management, playlist planning, workflow coordination, and playout control for broadcast channels.

- PWA
- Monolith
- Serverless
- Microservices

Version control:

- Git
- GitLab
- BitBucket

Other tools:

- TipTap
- HubSpot App
- Codex
- Claude code
- Wordpress
- GramJS
- ChartJS
- DndKit

LANGUAGES

- Russian | Native
- Belarusian | Advanced

Project Description:

Developed and maintained a large-scale React-based media management platform used for planning, organizing, validating, and monitoring broadcast content. The system supports complex scheduling workflows, content metadata management, live playlist operations, real-time updates, role-based access, and multi-channel configuration.

Key Features

- Content Manager for managing programs, episodes, promos, commercials, IDs, blocks, metadata, segmentation, music cues, and run logs.
- Planner module for building broadcast schedules with macro/micro blocks, drag-and-drop ordering, autofill/fillout tools, commercial assignment, playlist import/export, CSV/XLS downloads, and schedule synchronization.
- Workflow module for task management, timelines, labels, members, assignments, live task updates, filtering, searching, and task export.
- Playout module for managing on-air schedules, micro/macro views, dummy events, metadata, event ordering, and day-level operations.
- Playlist Checker and alerting tools for monitoring damaged files, on-air status, global system alerts, and operational issues.
- Live multiviewer support with multiple player backends, including HTML5/WebRTC, SLDP, MSE, and Redge.
- Role-based navigation and permissions for different account types, including planner, playout, global, admin, and supervisor users.
- Responsive mobile experience for dashboard, workflow, live preview, and event monitoring.
- Global and channel-level settings for system configuration, AV, FTP, metadata, email, workflow, planner, playout, and playlist checker modules.
- Real-time updates via WebSocket connections for planner and workflow data.
- Authentication, password recovery, user settings, profile management, notifications, and two-factor-related flows.

• **Qualified Health** (NextJs, React, TS, TanStack Query, Radix)

Qualified Health is a service that ensures no PII (Personally Identifiable Information) or PHI (Personal Health Information) is fed into any LLM (Large Language Models), preventing confidentiality breaches in the US. Primarily, this service functions as a smart filtering interface between the end user and LLMs.

I was responsible for developing web applications for the project. This includes a chat application for client communication. The second web application is an admin panel, designed to configure system settings and create/edit filters to prevent sensitive data like PII and PHI from leaking to third-party services. I also contributed to backend development.

• **Closed Interview Platform** (Web + Electron)

A secure, closed communication platform designed for conducting online interviews in controlled environments. The application was built as both a web and desktop (Electron) solution, ensuring cross-platform accessibility and stable real-time performance.

I developed the system using React + TypeScript on the frontend and Node.js on the backend, with a real-time architecture based on WebRTC. The platform supports reconnectable peer sessions and multi-peer connections, allowing stable communication even under unstable network conditions.

- Core features:
 - Creation and management of private interview rooms
 - Real-time video/audio communication via WebRTC
 - Automatic peer reconnection and multi-peer session handling
 - Internal real-time chat
 - Secure file sharing between participants
 - Simulation of system errors (for testing and scenario control)
 - Donation simulation mechanics within sessions

The project required handling complex real-time state synchronization, peer lifecycle management, and cross-platform packaging for Electron, with a strong focus on reliability and low-latency communication.

• **XLA Metaverse by Xsolla**

XLA Multiverse is a community-driven platform that connects the world's most prominent media universes with creators and businesses seeking to work together. I am responsible for developing the frontend part of the application from scratch. I communicate with the backend team to set up a fast and reliable system based on autogenerated content with a dynamic form builder that allows users to conveniently compose content for their metaverses. We also successfully collaborate with another international team that develops an additional part of our system to deliver a high-quality product for our client.
